Chapter 1

Observations on Taleb's "How much data do you need"

Introduction

Nassim Nicholas Taleb has recently released a paper entitled *How much data do you need? An operational metric for fat-tailedness*. to appear in the International Journal of Forecasting. The paper focuses on the preasymptotic behavior of the sum of independent identically distributed random variables that are governed by various fat-tailed distributions. He introduces a metric labeled "kappa" that's related to the growth rate of the mean absolute deviation (MAD) as the number of summands increases. Kappa is defined by the following formula.

$$\text{kappa}(n_0, n) = 2 \cdot (\log(n) - \log(n_0)) / (\log(\text{MAD}(n)) - \log(\text{MAD}(n_0)))$$

Normally distributed variables have a kappa of zero. Thus the extent to which kappa is in excess of zero measures the "fat-tailedness".

Purpose

Taleb analyzes a number of distributions to estimate their kappa. He gives explicit formulae for $\text{kappa}(1, 2)$, which he was able to derive analytically, but he also includes tables of $\text{kappa}(1, 30)$ and $\text{kappa}(1, 100)$ for two distributions, namely the Pareto distribution and Student's t distribution. This package is my effort to replicate those tables and perhaps add others for the other distributions. It's a work in process, as there are some items that I can't closely replicate.

What's included

I've experimented with two algorithms both implemented in C++, one of which relies on monte carlo simulations and the other of which relies on the use of the discrete fourier transform of the characteristic function of the convolution of the distribution functions. The package includes four files with code.

- [convolution_test.cpp](#). The main program to nun the convolution test.
- [monte_carlo_test.cpp](#). The main program to run the monte carlo test.
- [pareto_distribution.h](#). Contains a class for the pareto distribution, modeled on the classes in `boost::random` and including items normally computed in `boost::math::statistical_distributions`

- [student_t_distribution.h](#). Similar to pareto but starts as a derived class from `boost::random::student_t_distribution`
- [exponential_distribution.h](#). A derived class from `boost::random::exponential_distribution`
- [lognormal_distribution.h](#). A derived class from `boost::random::lognormal_distribution`. The class implementing the distribution includes several versions of the calculation of the characteristic function, some based on numerical integration from the definition, one based on a p-spline approximation to the more accurate but much slower integrals, and one based on a approximation using Lambert W functions.
- `lognormal_test.cpp`. A program to test the various version of the calculation of the characteristic function. So far the Lambert W version seems to be the best compromise between speed and accuracy, but it's not without problems.

In order to improve portability, a `meson.build` file is included, which allows an easy port to other systems once the needed packages are installed.

Observations

So far my results are close to Taleb's except for the cases where α is close to one. As Taleb mentions in his paper such distributions require huge amounts of data to produce reasonable estimates of the MAD and this fact is mirrored in the number of monte carlo runs or in the size the arrays used in the fast fourier transform. I'm pushing the limit of my computer's capability for the cases where $\alpha = 1.25$ or $\alpha = 1.5$. The convolution is limited by the size of available memory and the monte carlo approach is limited by the amount of time and the number of processors available.

I've experimented with other measures of scale, such as the 95% confidence interval spread, for which the amount of computation needed is much more modest, but these results may not be relevant if MAD is the measure which best characterizes the uncertainty.

To Do

- Switch to the parallel version of the `fftw`.

Acknowledgements

1. The package makes heavy use of the Boost C++ headers available at [boost](#)).
2. The package uses the Eigen headers for the purpose of wrapping the fast fourier transform code, and also uses unsupported Eigen headers for the calculation of splines. These are available at [Eigen](#).
3. As distributed the Eigen header wraps the `fftw3` available at `[fftw]`<http://fftw.org>. The `fftw` uses a GPL, so if you want a less restrictive license you should delete the line `#define EIGEN_FFTW_DEFAULT` at the beginning of `convolution`, which well revert to the `kissfft`.
4. One of the calculatations of the characteristic function for the lognormal distribution uses Lambert W functions. I've used the C++ code for the complex Lambert W function from [Istvan Mezo's web page](#).

License

The code included here is covered the the MIT license.

pareto_distribution< RealType >	26
student_t_distribution	
student_t_distribution< RealType >	30
Upper< Dist >	31

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

exponential_distribution< RealType >	
Instnaces of sturct exponential_distribution generate random variates for exponential distribution	9
Job	
Instances] of Job used to parcel characteristic funciion calculation to threads	10
KappaResult	
Structure holding the results of a run for a single alpha	12
KappaResults	
Structure holding the results of all runs	15
lognormal_distribution< RealType >	
Class with functions related to the lognormal distribution	17
Lower< Dist >	
Functor for determining lower limit for target mad	22
Numpunct	
Sturcture passed by imbue to ostreams to use commas in numbers	23
pareto_distribution< RealType >::param_type	23
pareto_distribution< RealType >	
Instantiations of class template pareto_distribution model a Pareto Type 2 distribution	26
student_t_distribution< RealType >	
Instances of class student_t_distribution give random variates for a student t distribution with parameter n = alpha	30
Upper< Dist >	
Functor for determining upper limit for target mad	31

Chapter 4

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

Chapter 5

Class Documentation

5.1 `exponential_distribution< RealType >` Struct Template Reference

instances of struct `exponential_distribution` generate random variates for exponential distribution

```
#include <exponential_distribution.h>
```

Inheritance diagram for `exponential_distribution< RealType >`:

Public Member Functions

- `exponential_distribution` (`RealType lambda`)
constructor give lambda
- `RealType cdf` (`RealType x`, `bool lower_tail=true`) `const`
return the cdf or the complement of the cdf
- `RealType pdf` (`RealType x`) `const`
return the pdf given x
- `RealType quantile` (`RealType p`) `const`
return the quantile give the probability p
- `RealType lambda` () `const`
return the lambda paramter of the distribution
- `RealType alpha_stable` () `const`
*return the alpha of the asymptotic stable distribution */*
- `RealType mean` () `const`
Return mean of distribution.
- `RealType mad` () `const`
Return mean average deviation of the distribution.
- `RealType mad2` () `const`
Return the mad of the square of the distribution.
- `RealType ci` (`RealType level=RealType(.05)`) `const`
Return the confidence interval of the distribution.
- `complex< RealType > characteristic_function` (`RealType omega`) `const`
return the characteristic function of the distribution given omega

Friends

- `template<class charT, class traits >`
`std::basic_ostream< charT, traits > & operator<< (std::basic_ostream< charT, traits > &os, const`
`exponential_distribution &dist)`
Write distribution to std::ostream.

5.1.1 Detailed Description

```
template<class RealType = double>
struct exponential_distribution< RealType >
```

instances of struct [exponential_distribution](#) generate random variates for exponential distribution

5.2 Job Struct Reference

instances] of [Job](#) used to parcel characteristic function calculation to threads

Public Member Functions

- [Job](#) (int [nmin](#), int [nmax](#), int [nchunk](#))
constructor
- bool [get_next](#) (int &nstart, int &nend)
get a range and return true if okay

Public Attributes

- int [nmin](#)
the overall minimum index
- int [nmax](#)
the overall maximum index
- int [ncurrent](#)
the next index to parcel out
- int [nchunk](#)
the size of the range to parcel out
- mutex [job_mutex](#)
to prevent multiple accesses

5.2.1 Detailed Description

instances] of [Job](#) used to parcel characteristic function calculation to threads

5.2.2 Constructor & Destructor Documentation

5.2.2.1 Job()

```
Job::Job (
    int nmin,
    int nmax,
    int nchunk ) [inline]
```

constructor

Parameters

in	<i>nmin</i>	the overall minimum index
in	<i>nmax</i>	the overall maximum index
in	<i>nchunk</i>	the size of the range to parcel out

5.2.3 Member Function Documentation

5.2.3.1 get_next()

```
bool Job::get_next (
    int & nstart,
    int & nend ) [inline]
```

get a range and return true if okay

Parameters

<i>nstart</i>	start of the assigned range
<i>nend</i>	next index after assigned range

The documentation for this struct was generated from the following file:

- [/Users/jdunn/Documents/XCode/how_much_data/convolution_test/convolution_test.cpp](#)

5.3 KappaResult Struct Reference

structure holding the results of a run for a single alpha

Public Member Functions

- [KappaResult](#) (vector< int > ns)
constructor
- void [calc_kappa](#) ()
calculate the kappa from the made variable
- void [initialize](#) (double param_in, const vector< int > &ns_in)
initialize the structure
- void [update_dev](#) (size_t m, size_t m_ci, const vector< double > &dev, const vector< double > &abs_dev, const vector< vector< double > > &x_in)
update the deviations w result from one thread
- void [update_conf_int](#) (double ci_level)
calculate the confidence interval for all trials

Public Attributes

- double [param](#)
the parameter for the run
- int [nsize](#)
the size of the vector passed to fft
- double [mad_rel_err](#)
the relative error of mad vs theory
- vector< int > [ns](#)
the durations saved
- vector< double > [mad](#)
the mean absolute deviation by duration
- vector< double > [kappa_mad](#)
- double [ci_rel_err](#)
the kappa_mad by duration
- vector< double > [ci](#)
the confidence interval by duration
- vector< double > [kappa_ci](#)
the kappa ci by duration
- size_t [m](#) = 0
the number of trials run for mad
- size_t [m_ci](#) = 0
the number of trials for the conf. interval
- vector< double > [sum_dev](#)
sum or raw deviation by duration
- vector< double > [sum_abs_dev](#)
sum of abs deviations by duration
- vector< vector< double > > [x_ci](#)
the results by trial and duration
- vector< double > [conf_int](#)
the calculated ci by duration
- cpu_times [elapsed_time](#)
the elapsed time for the run

5.3.1 Detailed Description

structure holding the results of a run for a single alpha

the struct holding the results of a single alpha

5.3.2 Constructor & Destructor Documentation

5.3.2.1 KappaResult()

```
KappaResult::KappaResult (
    vector< int > ns ) [inline]
```

constructor

Parameters

<i>ns</i>	the durations of the output
-----------	-----------------------------

5.3.3 Member Function Documentation

5.3.3.1 initialize()

```
void KappaResult::initialize (
    double param_in,
    const vector< int > & ns_in ) [inline]
```

initialize the structure

Parameters

<i>param_in</i>	the alpha of the run
<i>ns_in</i>	the durations of the run

5.3.3.2 update_conf_int()

```
void KappaResult::update_conf_int (
    double ci_level ) [inline]
```

calculate the confidence interval for all trials

Parameters

<i>ci_level</i>	the confidence level to use
-----------------	-----------------------------

5.3.3.3 update_dev()

```
void KappaResult::update_dev (
    size_t m,
    size_t m_ci,
    const vector< double > & dev,
    const vector< double > & abs_dev,
    const vector< vector< double > > & x_in ) [inline]
```

update the deviations w result from one thread

Parameters

<i>m</i>	the number of trials for mad
<i>m_ci</i>	the number of trials for ci
<i>dev</i>	sum of deviation by duration
<i>abs_dev</i>	sum of abs dev by duration
<i>x_in</i>	the variate by trial

5.3.4 Member Data Documentation

5.3.4.1 ci_rel_err

```
double KappaResult::ci_rel_err
```

the kappa_mad by duration

the relative error of the ci vs theory

the relative error of conf. int. vs theory

5.3.4.2 mad_rel_err

```
double KappaResult::mad_rel_err
```

the relative error of mad vs theory

the relative error of the mad vs theory

5.3.4.3 ns

```
vector< int > KappaResult::ns
```

the durations saved

the durations calculated

The documentation for this struct was generated from the following files:

- /Users/jdunn/Documents/XCode/how_much_data/convolution_test/convolution_test.cpp
- /Users/jdunn/Documents/XCode/how_much_data/monte_carlo_test/monte_carlo_test.cpp

5.4 KappaResults Struct Reference

structure holding the results of all runs

Public Member Functions

- [KappaResults](#) (const vector< int > &[ns](#), size_t n_params, string [param_label](#), size_t [taleb_offset](#))
constructor
- [KappaResult](#) & [at](#) (size_t i)
return reference to a particular result
- [KappaResults](#) (const vector< int > &[ns](#), const vector< double > ¶ms, const string [param_label](#), size_t [taleb_offset](#))
constructor

Public Attributes

- vector< int > [ns](#)
the durations saved
- string [param_label](#)
the name of the parameter
- vector< [KappaResult](#) > [kr](#)
the results of the runs by duration
- size_t [taleb_offset](#)
the column offset into Taleb's table
- mutex [kr_mutex](#)
a mutex for writing results

5.4.1 Detailed Description

structure holding the results of all runs

sturcture holding the results from all runs

5.4.2 Constructor & Destructor Documentation

5.4.2.1 KappaResults() [1/2]

```
KappaResults::KappaResults (
    const vector< int > & ns,
    size_t n_params,
    string param_label,
    size_t taleb_offset ) [inline]
```

constructor

Parameters

<i>ns</i>	the durations
<i>n_params</i>	the # of params
<i>param_label</i>	the param_label
<i>taleb_offset</i>	the column offset into Talebs table

5.4.2.2 KappaResults() [2/2]

```
KappaResults::KappaResults (
    const vector< int > & ns,
    const vector< double > & params,
    const string param_label,
    size_t taleb_offset ) [inline]
```

constructor

Parameters

<i>ns</i>	the durations calculated
<i>params</i>	the params for each run
<i>param_label</i>	the label for the param
<i>taleb_offset</i>	the column offset into the table of taleg's results. 0 for none

5.4.3 Member Data Documentation

5.4.3.1 ns

```
vector< int > KappaResults::ns
```

the durations saved

the durations calculated

5.4.3.2 param_label

```
string KappaResults::param_label
```

the name of the parameter

a vector holding the results of each run the label for the parameter

5.4.3.3 taleb_offset

```
size_t KappaResults::taleb_offset
```

the column offset into Taleb's table

the offset into Taleb's table of results. =0 for none available.

The documentation for this struct was generated from the following files:

- [/Users/jdunn/Documents/XCode/how_much_data/convolution_test/convolution_test.cpp](#)
- [/Users/jdunn/Documents/XCode/how_much_data/monte_carlo_test/monte_carlo_test.cpp](#)

5.5 lognormal_distribution< RealType > Struct Template Reference

a class with functions related to the lognormal distribution.

```
#include <lognormal_distribution.h>
```

Inheritance diagram for lognormal_distribution< RealType >:

Public Member Functions

- [lognormal_distribution](#) (RealType [mu](#), RealType [sigma](#), int type=1)
the constructor for the distribution
- template<typename Engine >
RealType [operator\(\)](#) (Engine &eng)
return a random number from the normalized distribution
- RealType [cdf](#) (RealType x, bool lower_tail=true) const
return the cumulative distribution function
- RealType [pdf](#) (RealType x) const
return the probability density function
- RealType [quantile](#) (RealType p) const
return the quantile corresponding to a given propability
- RealType [mu](#) () const
return the mu parameter of the distribution
- RealType [sigma](#) () const
return sigma parameter of the distribution
- RealType [alpha_stable](#) () const
return the alpha parameter of the asymptotically equivalent stable distribution
- RealType [min](#) () const
Returns the smallest value that the distribution can produce.
- RealType [max](#) () const
Returns the largest value that the distribution can produce.
- RealType [mean](#) () const
Return mean of distribution.
- RealType [mad](#) () const
Return mean absolute deviation of the distribution.
- RealType [mad2](#) () const
Return the mad of the square of the distribution.
- RealType [ci](#) (RealType level=RealType(.05)) const
Return the confidence interval of the distribution.
- complex< RealType > [cf_fourier_x](#) (RealType omega) const
return the characteristic function via Fourier integral in x domain
- complex< RealType > [cf_lambert_w](#) (RealType omega) const
return the approximate characteristic function using Lambert W fuction Much faster than either integral but has problems when sigma > 1
- complex< RealType > [cf_fourier_lnx](#) (RealType omega) const
Return the characteristic function via Fourier integral in ln(x) domain.
- complex< RealType > [characteristic_function](#) (RealType omega) const
return the approximate characteristic function using precompluted cubic splines

Friends

- template<class charT , class traits >
std::basic_ostream< charT, traits > & [operator<<](#) (std::basic_ostream< charT, traits > &os, const [lognormal_distribution](#) &dist)
Write distribution to std::ostream.

5.5.1 Detailed Description

```
template<class RealType = double>
struct lognormal_distribution< RealType >
```

a class with functions related to the lognormal distribution.

Describes a random variable distributed as $\exp(\sigma X + \mu)$ where X is normally distributed

5.5.2 Constructor & Destructor Documentation

5.5.2.1 lognormal_distribution()

```
template<class RealType = double>
lognormal_distribution< RealType >::lognormal_distribution (
    RealType mu,
    RealType sigma,
    int type = 1 ) [inline]
```

the constructor for the distribution

Parameters

in	<i>mu</i>	the mu parameter
in	<i>sigma</i>	the sigma parameter
in	<i>type</i>	type of cf calculaiton 1 ln(x), 2 x, 3 w, 4 spline

5.5.3 Member Function Documentation

5.5.3.1 cdf()

```
template<class RealType = double>
RealType lognormal_distribution< RealType >::cdf (
    RealType x,
    bool lower_tail = true ) const [inline]
```

return the cumulative distribution function

Parameters

in	<i>x</i>	the quantile variable
in	<i>lower_tail</i>	flag indicating which tail to use

5.5.3.2 `cf_fourier_lnx()`

```
template<class RealType = double>
complex<RealType> lognormal_distribution< RealType >::cf_fourier_lnx (
    RealType omega ) const [inline]
```

Return the characteristic function via Fourier integral in $\ln(x)$ domain.

Parameters

<i>omega</i>	the angular frequency
--------------	-----------------------

5.5.3.3 `cf_fourier_x()`

```
template<class RealType = double>
complex<RealType> lognormal_distribution< RealType >::cf_fourier_x (
    RealType omega ) const [inline]
```

return the characteristic function via Fourier integral in x domain

Parameters

<i>omega</i>	the angular frequency
--------------	-----------------------

5.5.3.4 `cf_lambert_w()`

```
template<class RealType = double>
complex<RealType> lognormal_distribution< RealType >::cf_lambert_w (
    RealType omega ) const [inline]
```

return the approximate characteristic function using Lambert W function. Much faster than either integral but has problems when $\sigma > 1$

Parameters

<i>omega</i>	the angular frequency
--------------	-----------------------

5.5.3.5 `characteristic_function()`

```
template<class RealType = double>
```

```
complex<RealType> lognormal_distribution< RealType >::characteristic_function (
    RealType omega ) const [inline]
```

return the approximate characteristic function using precomputed cubic splines

Parameters

in	<i>omega</i>	the angular frequency
----	--------------	-----------------------

5.5.3.6 mad2()

```
template<class RealType = double>
RealType lognormal_distribution< RealType >::mad2 ( ) const [inline]
```

Return the mad of the square of the distribution.

this is the approximation used by Taleb

5.5.3.7 max()

```
template<class RealType = double>
RealType lognormal_distribution< RealType >::max ( ) const [inline]
```

Returns the largest value that the distribution can produce.

5.5.3.8 min()

```
template<class RealType = double>
RealType lognormal_distribution< RealType >::min ( ) const [inline]
```

Returns the smallest value that the distribution can produce.

5.5.3.9 pdf()

```
template<class RealType = double>
RealType lognormal_distribution< RealType >::pdf (
    RealType x ) const [inline]
```

return the probability density function

Parameters

<i>x</i>	the quantile variable
----------	-----------------------

5.5.3.10 quantile()

```
template<class RealType = double>
RealType lognormal_distribution< RealType >::quantile (
    RealType p ) const [inline]
```

return the quantile corresponding to a given propability

Parameters

p	the target probability
-----	------------------------

- /Users/jdunn/Documents/XCode/how_much_data/convolution_test/lognormal_distribution.h

5.6 Lower< Dist > Class Template Reference

functor for determining lower limit for target mad

Public Member Functions

- [Lower](#) (double delta, Dist &dist)
constructor
- double **operator()** (double x)

5.6.1 Detailed Description

```
template<typename Dist>
class Lower< Dist >
```

functor for determining lower limit for target mad

5.6.2 Constructor & Destructor Documentation

5.6.2.1 Lower()

```
template<typename Dist >
Lower< Dist >::Lower (
    double delta,
    Dist & dist ) [inline]
```

constructor

Parameters

<i>delta</i>	the target mad arising from lower tail
<i>dist</i>	the distribution

The documentation for this class was generated from the following file:

- /Users/jdunn/Documents/XCode/how_much_data/convolution_test/convolution_test.cpp

5.7 Numpunct Struct Reference

sturcture passed by imbue to ostreams to use commas in numbers

Inheritance diagram for Numpunct:

Protected Member Functions

- virtual char **do_thousands_sep** () const
- virtual std::string **do_grouping** () const

5.7.1 Detailed Description

sturcture passed by imbue to ostreams to use commas in numbers

The documentation for this struct was generated from the following file:

- /Users/jdunn/Documents/XCode/how_much_data/convolution_test/convolution_test.cpp

5.8 `pareto_distribution< RealType >::param_type` Class Reference

Public Types

- typedef [pareto_distribution](#) **distribution_type**

Public Member Functions

- [param_type](#) (RealType alpha_arg, RealType mu_arg=RealType(0.0), RealType sigma_arg=RealType(1.0))
Constructs the parameters of a [pareto_distribution](#).
- RealType [alpha](#) () const
Returns the "alpha" parameter of the distribution.
- RealType [mu](#) () const
Returns the "mu" parameter of the distribution.
- RealType [sigma](#) () const
Returns the "sigma" parameter of the distribution.

Friends

- template<class charT , class traits >
std::basic_ostream< charT, traits > & [operator<<](#) (std::basic_ostream< charT, traits > &os, const [param_type](#) &parm)
Writes the parameters to a std::ostream.
- template<class charT , class traits >
std::basic_istream< charT, traits > & [operator>>](#) (std::basic_istream< charT, traits > &is, [param_type](#) &parm)
Reads the parameters from a std::istream.
- bool [operator==](#) (const [param_type](#) &lhs, const [param_type](#) &rhs)
Returns true if the two sets of parameters are equal.
- bool [operator!=](#) (const [param_type](#) &lhs, const [param_type](#) &rhs)
Returns true if the two sets of parameters are different.

5.8.1 Constructor & Destructor Documentation

5.8.1.1 param_type()

```
template<class RealType = double>
pareto\_distribution< RealType >::param_type::param_type (
    RealType alpha_arg,
    RealType mu_arg = RealType(0.0),
    RealType sigma_arg = RealType(1.0) ) [inline], [explicit]
```

Constructs the parameters of a [pareto_distribution](#).

5.8.2 Member Function Documentation

5.8.2.1 alpha()

```
template<class RealType = double>
RealType pareto_distribution< RealType >::param_type::alpha ( ) const [inline]
```

Returns the "alpha" parameter of the distribution.

5.8.2.2 mu()

```
template<class RealType = double>
RealType pareto_distribution< RealType >::param_type::mu ( ) const [inline]
```

Returns the "mu" parameter of the distribution.

5.8.2.3 sigma()

```
template<class RealType = double>
RealType pareto_distribution< RealType >::param_type::sigma ( ) const [inline]
```

Returns the "sigma" parameter of the distribution.

5.8.3 Friends And Related Function Documentation

5.8.3.1 operator!=

```
template<class RealType = double>
bool operator!= (
    const param_type & lhs,
    const param_type & rhs ) [friend]
```

Returns true if the two sets of parameters are different.

5.8.3.2 operator<<

```
template<class RealType = double>
template<class charT , class traits >
std::basic_ostream<charT,traits>& operator<< (
    std::basic_ostream< charT, traits > & os,
    const param_type & parm ) [friend]
```

Writes the parameters to a std::ostream.

5.8.3.3 operator==

```
template<class RealType = double>
bool operator== (
    const param_type & lhs,
    const param_type & rhs ) [friend]
```

Returns true if the two sets of parameters are equal.

5.8.3.4 operator>>

```
template<class RealType = double>
template<class charT , class traits >
std::basic_istream<charT,traits>& operator>> (
    std::basic_istream< charT, traits > & is,
    param_type & parm ) [friend]
```

Reads the parameters from a std::istream.

The documentation for this class was generated from the following file:

- [/Users/jdunn/Documents/XCode/how_much_data/convolution_test/pareto_distribution.h](#)

5.9 pareto_distribution< RealType > Class Template Reference

Instantiations of class template [pareto_distribution](#) model a Pareto Type 2 distribution.

```
#include <pareto_distribution.h>
```

Classes

- class [param_type](#)

Public Types

- typedef RealType **result_type**

Public Member Functions

- `pareto_distribution` (`RealType` `alpha_arg`, `RealType` `mu_arg`=`RealType`(0.0), `RealType` `sigma_arg`=`RealType`(1.0))
Constructs a `pareto_distribution`.
- `pareto_distribution` (const `param_type` &`parm`)
Constructs a `pareto_distribution` from its parameters.
- `RealType` `alpha` () const
Returns the alpha parameter of the distribution.
- `RealType` `mu` () const
Returns the mu parameter of the distribution.
- `RealType` `sigma` () const
Returns the sigma parameter of the distribution.
- `RealType` `alpha_stable` () const
Return the alpha of the asymptotic stable distribution.
- `RealType` `min` () const
Returns the smallest value that the distribution can produce.
- `RealType` `max` () const
Returns the largest value that the distribution can produce.
- `param_type` `param` () const
Returns the parameters of the distribution.
- void `param` (const `param_type` &`parm`)
Sets the parameters of the distribution.
- `RealType` `cdf` (`RealType` `x`, bool `lower_tail`=true) const
the cdf of the distribution
- `RealType` `pdf` (`RealType` `x`) const
return the pdf of the distribution
- `RealType` `quantile` (`RealType` `p`) const
the quantile for a given probability
- `RealType` `mean` () const
Return the mean of the distribution.
- `RealType` `mad` () const
Return the MAD of the distribution.
- `RealType` `mad2` () const
Return the MAD of the square of the distribution.
- `complex< RealType >` `characteristic_function` (`RealType` `omega`) const
return the characteristic function of the distribution
- `RealType` `ci` (`RealType` `level`=`RealType`(.05)) const
Return the 95% confidence interval.
- void `reset` ()
Effects: Subsequent uses of the distribution do not depend on values produced by any engine prior to invoking reset.
- `template<class Engine >`
`result_type` `operator()` (`Engine` &`eng`) const
Returns a random variate distributed according to the Pareto distribution.
- `template<class Engine >`
`result_type` `operator()` (`Engine` &`eng`, const `param_type` &`parm`)
Returns a random variate distributed according to the Pareto distribution with parameters specified by param.

Friends

- `template<class charT , class traits >`
`std::basic_ostream< charT, traits > & operator<< (std::basic_ostream< charT, traits > &os, const`
`pareto_distribution &dist)`
Write distribution to std::ostream.
- `template<class charT , class traits >`
`std::basic_istream< charT, traits > & operator>> (std::basic_istream< charT, traits > &is, pareto_distribution`
`&dist)`
Reads the parameters from a std::istream.
- `bool operator== (const pareto_distribution &lhs, const pareto_distribution &rhs)`
Returns true if the two distributions will produce identical sequences of values given equal generators.
- `bool operator!= (const pareto_distribution &lhs, const pareto_distribution &rhs)`
Returns true if the two distributions may produce different sequences of values given equal generators.

5.9.1 Detailed Description

```
template<class RealType = double>
class pareto_distribution< RealType >
```

Instantiations of class template `pareto_distribution` model a Pareto Type 2 distribution.

Such a distribution produces random numbers with $1 - F(x) = (1 + \frac{x - \mu}{\sigma})^{-\alpha}$ for $x > \mu$.

5.9.2 Constructor & Destructor Documentation

5.9.2.1 pareto_distribution()

```
template<class RealType = double>
pareto_distribution< RealType >::pareto_distribution (
    RealType alpha_arg,
    RealType mu_arg = RealType(0.0),
    RealType sigma_arg = RealType(1.0) ) [inline], [explicit]
```

Constructs a `pareto_distribution`.

`alpha` `mu` and `sigma` are the parameters of the distribution.

5.9.3 Member Function Documentation

5.9.3.1 `alpha()`

```
template<class RealType = double>
RealType pareto_distribution< RealType >::alpha ( ) const [inline]
```

Returns the alpha parameter of the distribution.

5.9.3.2 `max()`

```
template<class RealType = double>
RealType pareto_distribution< RealType >::max ( ) const [inline]
```

Returns the largest value that the distribution can produce.

5.9.3.3 `min()`

```
template<class RealType = double>
RealType pareto_distribution< RealType >::min ( ) const [inline]
```

Returns the smallest value that the distribution can produce.

5.9.3.4 `mu()`

```
template<class RealType = double>
RealType pareto_distribution< RealType >::mu ( ) const [inline]
```

Returns the mu parameter of the distribution.

5.9.3.5 `param()` [1/2]

```
template<class RealType = double>
param_type pareto_distribution< RealType >::param ( ) const [inline]
```

Returns the parameters of the distribution.

5.9.3.6 param() [2/2]

```
template<class RealType = double>
void pareto\_distribution< RealType >::param (
    const param\_type & parm ) [inline]
```

Sets the parameters of the distribution.

5.9.3.7 sigma()

```
template<class RealType = double>
RealType pareto\_distribution< RealType >::sigma ( ) const [inline]
```

Returns the sigma parameter of the distribution.

5.9.4 Friends And Related Function Documentation

5.9.4.1 operator>>

```
template<class RealType = double>
template<class charT , class traits >
std::basic_istream<charT,traits>& operator>> (
    std::basic_istream< charT, traits > & is,
    pareto\_distribution< RealType > & dist ) [friend]
```

Reads the parameters from a std::istream.

The documentation for this class was generated from the following file:

- [/Users/jdunn/Documents/XCode/how_much_data/convolution_test/pareto_distribution.h](#)

5.10 [student_t_distribution](#)< RealType > Struct Template Reference

Instances of class [student_t_distribution](#) give random variates for a student t distribution with parameter n = alpha.

```
#include <student_t_distribution.h>
```

Inheritance diagram for [student_t_distribution](#)< RealType >:

Public Member Functions

- [student_t_distribution](#) (RealType alpha)
construct an instance give alpha
- RealType [cdf](#) (RealType x, bool lower_tail=true) const
return the cdf or the complement of the cdf
- RealType [pdf](#) (RealType x) const
return the probability density function at x
- RealType [quantile](#) (RealType p) const
return the quantile for probability p
- RealType [alpha](#) () const
return the alpha = n of the distribution
- RealType [alpha_stable](#) () const
return the alpha of the asymptotic stable distribution
- RealType [mean](#) () const
Return mean of distribution.
- RealType [mad](#) () const
Return mean average deviation of the distribution.
- RealType [mad2](#) () const
Return the mad of the square of the distribution.
- RealType [ci](#) (RealType level=RealType(.05)) const
Return the confidence interval of the distribution.
- RealType [characteristic_function](#) (RealType omega) const
return the characteristic function of the distribution at omega

Friends

- `template<class charT, class traits >
std::basic_ostream< charT, traits > & operator<< (std::basic_ostream< charT, traits > &os, const
student_t_distribution &dist)
Write distribution to std::ostream.`

5.10.1 Detailed Description

```
template<class RealType = double>
struct student_t_distribution< RealType >
```

Instances of class [student_t_distribution](#) give random variates for a student t distribution with parameter n = alpha.

The documentation for this struct was generated from the following file:

5.11 Upper< Dist > Class Template Reference

functor for determining upper limit for target mad

Public Member Functions

- [Upper](#) (double delta, Dist &dist)
constructor
- double [operator\(\)](#) (double x)
return excess of estimated mad in tail over target

5.11.1 Detailed Description

```
template<typename Dist>
class Upper< Dist >
```

functor for determining upper limit for target mad

5.11.2 Constructor & Destructor Documentation

5.11.2.1 Upper()

```
template<typename Dist >
Upper< Dist >::Upper (
    double delta,
    Dist & dist ) [inline]
```

constructor

Parameters

<i>delta</i>	target mad arising from upper tail
<i>dist</i>	reference to distribution

5.11.3 Member Function Documentation

5.11.3.1 operator>()

```
template<typename Dist >
double Upper< Dist >::operator() (
    double x ) [inline]
```

return excess of estimated mad in tail over target

Parameters

x	the quantile
-----	--------------

Classes

- struct [Numpunct](#)
structure passed by imbue to ostream to use commas in numbers
- struct [KappaResult](#)
structure holding the results of a run for a single alpha
- struct [KappaResults](#)
structure holding the results of all runs

- class [Upper< Dist >](#)
functor for determining upper limit for target mad
- class [Lower< Dist >](#)
functor for determining lower limit for target mad
- struct [Job](#)
instances] of [Job](#) used to parcel characteristic funciion calculation to threads

Typedefs

- using **dcomplex** = std::complex< double >

Functions

- template<typename RealType >
RealType [rel_err](#) (RealType a, RealType b)
return the relative differnece between two numbers
- ostream & [operator<<](#) (ostream &os, const [KappaResult](#) &k)
output the results to an ostream
- ostream & [operator<<](#) (ostream &os, [KappaResults](#) &ks)
output the results of all runs to an ostream
- int [mod](#) (int a, int b)
modulo calculation return nonnegative numer less than the modulus
- double [confidence_interval](#) (int nmin, int nmax, double delta, const vector< double > &pdf, const vector< double > &x, double ci_level)
calculate confidence interval given pdf at points in range
- bool [factor_check](#) (int n, vector< int > primes)
Check whether the factorization of n contains only listed primes.
- template<typename Dist >
void [calc_characteristic_function](#) (const Dist &dist, const double mean, const int n, const double delta_omega, [Job](#) *job, vector< dcomplex > *adj_cf)
calculate the characteristic function for a range assigned to tthead
- template<typename Dist >
void [calculate_kappa](#) (double delta, double delta2, int m, vector< int > ns, Dist dist, double ci_level, [KappaResult](#) &k, bool verbose=false)
set up ranges and step sizes for one alpham pass calculation of cf to threads and use fft to estimate distribution
- void [show_usage](#) (path p)
show proper usage after improper command line argument
- int [main](#) (int argc, const char *argv[])
main program for convolution_testl

Variables

- Eigen::FFT< double > [fft_eng](#)
cause Eigen/FFT to use fftw. delete to avoid GPL

6.1.1 Function Documentation

6.1.1.1 calc_characteristic_function()

```
template<typename Dist >
void calc_characteristic_function (
    const Dist & dist,
    const double mean,
    const int n,
    const double delta_omega,
    Job * job,
    vector< dcomplex > * adj_cf )
```

calculate the characteristic function for a range assigned to tthead

Parameters

in	<i>dist</i>	the distribution
in	<i>mean</i>	the mean to remove
in	<i>n</i>	the duration
in	<i>delta_omega</i>	step for omega
in, out	<i>job</i>	ptr to job assigner
out	<i>adj_cf</i>	the characeristic function of the normalized distrbution

6.1.1.2 calculate_kappa()

```
template<typename Dist >
void calculate_kappa (
    double delta,
    double delta2,
    int m,
    vector< int > ns,
    Dist dist,
    double ci_level,
    KappaResult & k,
    bool verbose = false )
```

set up ranges and step sizes for one alpham pass calculation of cf to threads and use fft to estimate distribution

Parameters

in	<i>delta</i>	the step size in x / dist.mad
in	<i>delta2</i>	cap on % mad from the tail
in	<i>m</i>	cap on maximum index
in	<i>ns</i>	the durations to calculate
in	<i>dist</i>	the distribution
in	<i>ci_level</i>	the confidence level for kappa_ci
out	<i>k</i>	the results
in	<i>verbose</i>	flag for trace

6.1.1.3 confidence_interval()

```
double confidence_interval (
    int nmin,
    int nmax,
    double delta,
    const vector< double > & pdf,
    const vector< double > & x,
    double ci_level )
```

calculate confidence interval given pdf at points in range

Parameters

in	<i>nmin</i>	the minimum index
in	<i>nmax</i>	the maximum index
in	<i>delta</i>	the spacing of the x's
in	<i>pdf</i>	the calculated pdf's
in	<i>x</i>	the x for the pdf
in	<i>ci_level</i>	the confidence level

6.1.1.4 factor_check()

```
bool factor_check (
    int n,
    vector< int > primes )
```

Check whether the factorization of n contains only listed primes.

Parameters

<i>n</i>	the number to check
<i>primes</i>	the array of candidate primes

6.1.1.5 show_usage()

```
void show_usage (
    path p )
```

show proper usage after improper command line argument

Parameters

in	<i>p</i>	the path of the executable
----	----------	----------------------------

```

Classes

- struct [KappaResult](#)
structure holding the results of a run for a single alpha
- struct [KappaResults](#)
structure holding the results of all runs

Functions

- `template<typename RealType >`
`RealType rel_err (RealType a, RealType b)`
return the relative error between two numbers
- `template<typename RealType >`
`vector< RealType > quantile (const vector< RealType > &x, const vector< RealType > &probs)`
return quantiles of the ensemble of trials
- `ostream & operator<< (ostream &os, const KappaResult &k)`
output the results from a single run
- `ostream & operator<< (ostream &os, KappaResults &ks)`
output the results for all runs
- `template<typename Dist >`
`void calc_kappa (unsigned int thread_id, size_t m, size_t m_ci_limit, vector< int > ns, Dist dist, double ci_level, KappaResult *kp, bool verbose=false)`
the per thread cacluaiton engine
- `template<typename Dist >`
`void calculate_kappa (size_t m, vector< int > ns, Dist dist, double ci_level, KappaResult *kp, bool verbose=false)`
calculate kappa for sums of iid variables at specified durations
- `void show_usage (path p)`
show the usage. called when the wrong # of arguments is used
- `int main (int argc, const char *argv[])`
main program for convolution test with one input parameter the # of trials

Variables

- mutex `kr_mutex`
a mutex for writing to KappaResults
- mutex `cout_mutex`
a mutex for writing to cout

6.6.1 Function Documentation

6.6.1.1 calc_kappa()

```
template<typename Dist >
void calc_kappa (
    unsigned int thread_id,
    size_t m,
    size_t m_ci_limit,
    vector< int > ns,
    Dist dist,
    double ci_level,
    KappaResult * kp,
    bool verbose = false )
```

the per thread cacluaiton engine

Parameters

in	<i>thread_id</i>	the number of the thread used as seed for urng
in	<i>m</i>	the maximum # of trials for mad
in	<i>m_ci_limit</i>	the maximum # of trials for ci
in	<i>ns</i>	the durations to save
in	<i>dist</i>	the distribution
in	<i>ci_level</i>	the confidence level for kappa_ci
out	<i>kp</i>	the results
in	<i>verbose</i>	flag for trace information

6.6.1.2 calculate_kappa()

```
template<typename Dist >
void calculate_kappa (
    size_t m,
    vector< int > ns,
    Dist dist,
    double ci_level,
    KappaResult * kp,
    bool verbose = false )
```

calculate kappa for sums of iid variables at specified durations

Parameters

in	<i>m</i>	the number of scenarios
in	<i>ns</i>	the durations to save
in	<i>dist</i>	the distribution
in	<i>ci_level</i>	the confidence level to use
out	<i>kp</i>	a ptr to the results
in	<i>verbose</i>	a flag to generate trace

6.6.1.3 operator<<()

```
ostream& operator<< (
    ostream & os,
    const KappaResult & k )
```

output the results from a single run

Parameters

in, out	<i>os</i>	the output stream
in	<i>k</i>	the struct with results

6.6.1.4 quantile()

```
template<typename RealType >
vector<RealType> quantile (
    const vector< RealType > & x,
    const vector< RealType > & probs )
```

return quantiles of the ensemble of trials

Parameters

in	<i>x</i>	the result by trial
in	<i>probs</i>	the desired probabilities

6.6.1.5 rel_err()

```
template<typename RealType >
RealType rel_err (
    RealType a,
    RealType b )
```

return the relative error between two numbers

Parameters

in	<i>a</i>	the first number
in	<i>b</i>	the second number
